Application Guide

D-View Micro-perforated Window Film. Outside Application - Dry

Make sure that the glass is thoroughly cleaned and free from dust, grease or any contamination that could affect the adhesion of the material.

A second cleaning may be beneficial before finally rinsing with fresh water and allow to dry thoroughly.

Before starting make sure you have all the right tools for the job. We recommend using a low friction squeegee as well as having a sharp knife and a straight edge ruler to hand. During the application process it is important to take care and avoid touching the adhesive side of the film.

Firstly, remove the top 25mm - 50mm of the liner and align your starting position at the top of the glass.

Carefully squeegee from the centre of the film towards the edges. Handle with care as you progress down the graphic and ensure that no air bubbles are trapped beneath the surface.

Once the graphic has been applied cut the graphic back from the edges by between 1mm - 3mm using either a straight edge or the plastic edge of a squeegee and taking care not to scratch the glass. This will ensure adequate adhesion at the edges.

If joining two pieces of material always use a butt join. To do this, remove 25mm - 50mm of liner from the second panel and align the design to match. Apply the second panel with the overlap and cut through both layers of material taking care not to scratch the glass. Remove the cut strip from both panels to form a clean butt joint.

Finally, re-squeegee the whole area, working towards the edges and do not wash for at least 24 hours to ensure adequate adhesive strength.
